DEPI graduation project | Odoo consultant track

Smart Core

Odoo 19 Enterprise implementation for Beitak Smart

Home appliances: import, distribution, showroom retail and in-house assembly

Presented by Khomasi ERP

Ahmed Fahmy — Project Manager & Manufacturing

Lobna Zanaty — Accounting

Mayada Salah — Inventory

Noha Gamal — Sales, CRM & POS

Omar ElSayed — HR, Purchase & Technical

Go-live 1 January 2027

What we will cover

01

The client

Who Beitak Smart is and how it works today

02

The problem

14 pain points costing money and visibility

03

Our approach

Methodology, documents and governance

04

The solution

9 modules, 70 requirements, 11 customizations

05

The data

Entity data and 27 import files

06

Delivery

UAT, training, go-live and investment

Part 01

The client: Beitak Smart

An appliance business running on a legacy accounting package, Excel and a standalone cashier program

Beitak Smart at a glance

Imports and distributes appliances, assembles its own fan and components, and sells through a Cairo showroom

40	20	5	36	30
appliance models	brands	warehouses	employees	Odoo users

Trading	Imports from China in USD and buys from local agents; sells to 12 retailers, 2 distributors and 3 corporate clients
Assembly	Own-brand stand fan, control boards, metal casings, harnesses and filters in a Cairo assembly unit
Retail	Cairo showroom selling to walk-in customers on a standalone cashier program
Services	Air-conditioner and TV wall-mount installation sold with the appliance

The problems we found

14 pain points from discovery workshops with every department — the six with the highest impact

01

Landed costs never reach item cost

Freight, duties and clearance stay in Excel, so margins look better than they are

03

Stock-outs and overstock

No min / max rules against 45-60 day import lead times

05

Assembled product cost unknown

Component consumption, labour and scrap are never recorded

07

Receivables out of control

Cheques tracked in Excel; credit limits exist on paper only

09

No profitability by line or branch

Management cannot tell trading from manufacturing, or Cairo from Asyut

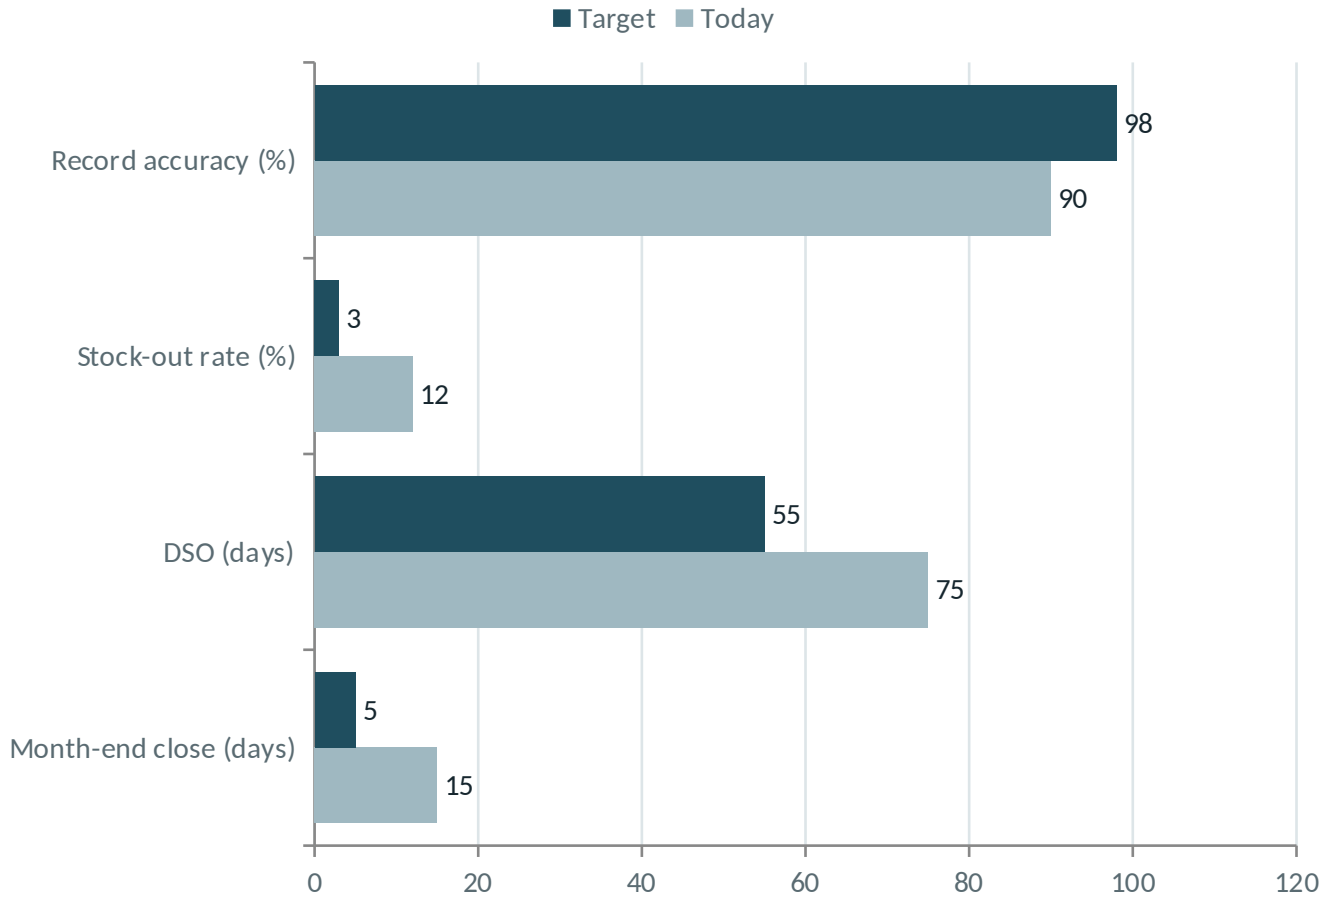

10

Month-end close takes 15 days

Everything is re-keyed between Excel and the legacy package

What success looks like

Eight KPIs agreed with the client, measured six months after go-live

Also measured

- Landed costs allocated on 100% of import shipments
- P&L by branch and business line available by working day 5
- 100% of B2B opportunities tracked in the CRM pipeline
- Showroom sales posted to stock and accounting daily instead of weekly

Baselines are discovery estimates

Part 02

How we ran the project

Eight phases, seven milestones, and a document at every gate

Implementation methodology

13 weeks from kick-off on 4 October 2026 to go-live on 1 January 2027, then four weeks of hypercare

1	2	3	4	5	6	7	8
Discovery	**Analysis**	**Design**	**Build & migrate**	**UAT**	**Training**	**Cutover**	**Hypercare**
W1-2	W2-4	W4-5	W6-9	W10-11	W11-12	W13	Jan

Milestones with client sign-off

M2 — **BRD signed**
22 Oct 2026

M3 — **Design & proposals signed**
5 Nov 2026

M4 — **Build & migration complete**
3 Dec 2026

M5 — **UAT signed**
17 Dec 2026

M6 — **Go-live**
1 Jan 2027

M7 — **Hypercare closed**
28 Jan 2027

What we delivered

Four folders in one GitHub repository — every document traceable to the one before it

01

Presentation

- Slide deck (PPTX + PDF)
- Demo video of the live system

02

Preparations

- Company Profile
- Project Name & Scope
- Team & Roles + RACI
- Basic Database Configuration

03

Project documents

- BRD · RTM · GAWF · SSD
- TPD · FPD + cost model
- UPD · TD · UDP · UATD

04

Entity data & setup

- 3 entity-data workbooks
- 27 Odoo import files
- Go-Live & Deployment Plan

Part 03

The solution

Nine Odoo modules covering every department, designed around 70 agreed requirements

Nine modules, one database

Each module owned by one consultant and signed off by one key user at the client

CRM

Pipeline for 6 sales teams, activities, lost reasons

Sales

4 price lists, credit control, discount approval, margins

Point of Sale

Cairo showroom: barcode, serials, cash / card / account

Purchase

USD vendors, PO approval, three-way match, landed costs

Inventory

5 warehouses, multi-step routes, 1,546 serials, counts

Manufacturing

11 BOMs, 5 work centers, work orders, real cost

Accounting

Egypt localization, VAT & WHT, 9 journals, analytic P&L

Employees

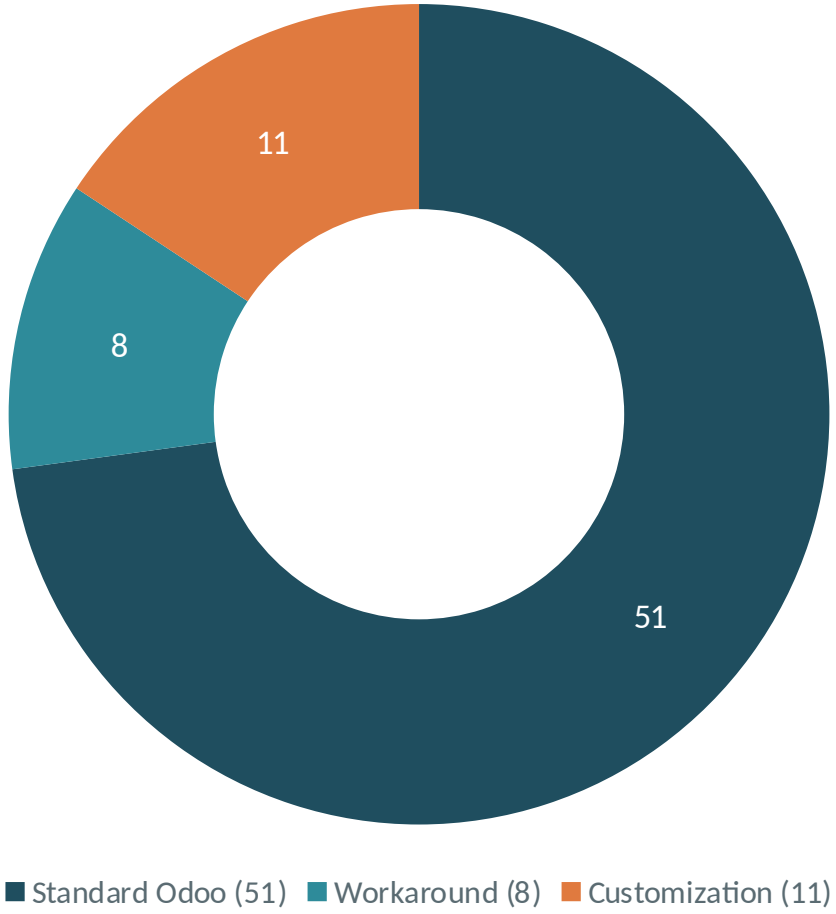

36 employees, time off, attendance kiosk

Approvals

Purchase, payment, discount and credit-limit gates

Standard first, customize last

70 requirements classified in the gap analysis — the programme guideline is roughly 70 / 10-15 / 15-20

Why it matters

- 73% standard keeps upgrades cheap and safe
- 11% workarounds use standard features in a defined way, documented for training
- 16% customizations are Studio fields, approval rules and report layouts — no custom modules

11 customizations = 15 consultant days

Bilingual invoice and delivery note, import container tracking, warranty dates, credit-limit and discount approval, commission and shipment cost reports

Fixing the cost problem: procure to pay

From a USD purchase order in China to a product cost that finally includes freight, duties, clearance and insurance

RFQ & PO
USD vendor price
GM approves

→

Shipment
Container, B/L, ETA
tracked on the PO

→

Receipt
Input → QC → Stock
serials scanned

→

Bills
Freight, duties,
clearance, insurance

→

Landed cost
Allocated to the
receipt lines

→

Real cost
Product cost and
margin are correct

The accounting behind it

Receipt	Dr Inventory 1201xx	Cr GRNI 120900
Vendor bill	Dr GRNI + VAT input	Cr Payables 211200 (USD)
Cost bills	Dr Clearing 1301xx	Cr Payables 211100
Landed cost	Dr Inventory 1201xx	Cr Clearing 1301xx → zero

Before

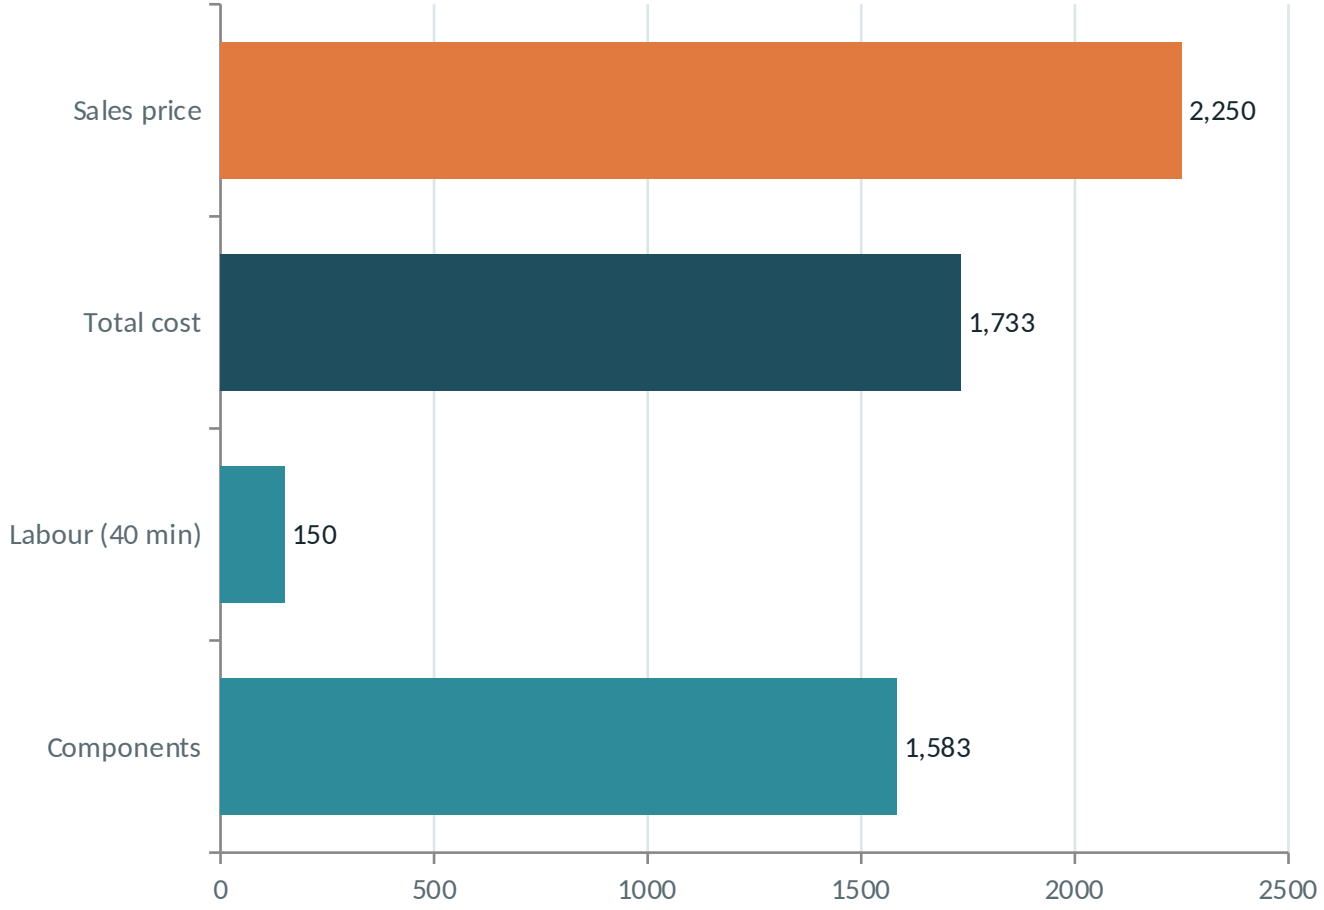

Cost = invoice price only;
freight and duties sat in Excel

After

Cost includes about 10% landed costs, so margin and COGS are real

Costing the Beitak stand fan

A multi-level BOM: the fan control board is produced first, then consumed by the fan — labour comes from work-center rates

How the cost is built

- 12 components including the in-house control board
- 2 operations: assembly line and QC & packing
- AVCO valuation posts every move automatically

23%

gross margin

11

BOMs costed

Before: the fan cost was a guess. Now every manufacturing order shows planned versus real cost.

Selling with control

Pricing, credit and the showroom brought into the same system as stock and accounting

1

Pricing

4 price lists (retail, wholesale, distributor, key account) with quantity breaks, all driven from the list price — one change updates every segment

2

Credit control

Credit limit per customer with a warning on the order, and confirmation blocked above the limit until the Finance Manager approves

3

Discounts

Any line discount above 10% needs Sales Manager approval, logged in the document chatter

4

Showroom

POS linked to Cairo stock: barcode scanning, a serial captured for every appliance, cash / card / customer account, and a cash count at closing

5

Traceability

1,546 serial numbers from receipt through delivery to warranty and returns

Why the client cares

Prices stop drifting between reps, overdue customers stop receiving goods, and showroom sales hit stock and the general ledger the same day instead of once a week.

Accounting that closes in five days

Egyptian localization, two analytic plans, and every stock and sales movement posting itself

61

accounts added

on top of the Egypt localization

9

journals

4 bank · 4 cash · opening

2

analytic plans

business line · branch

14%

VAT + WHT

1% / 2% / 3% withholding

Correct by design

COGS accounts are Cost of Revenue, inventory is valued per category, and interim accounts clear themselves

Multi-currency

Only the CIB account is fixed in USD, so overseas bills post and the exchange difference lands in the right account

Post-dated cheques

Received and issued cheques sit in notes accounts with their maturity date until they clear

Profitability

P&L by trading, manufacturing and services, and by each of the five branches plus the showroom

Part 04

The data behind the system

All 15 entity-data items collected, cleansed and turned into 27 ready-to-load import files

Entity data and migration

Every figure in the deck comes from these files — they are the system, not a description of it

89	11	32	1,546	36	27
products	BOMs	customers & vendors	serial numbers	employees	import files

Three entity-data workbooks

- Organization & accounting: org chart, users, chart of accounts, opening balances, banks, safes, journals, taxes
- Products & inventory: categories, products, BOMs, work centers, price lists, warehouses, stock by location
- Partners & cycles: customers, vendors, approvals matrix and six business cycles

Opening balances validated

Trial balance	40,474,776.50 EGP each side
Inventory	20,424,776.50 EGP = quantity × cost
Receivables / payables	split by partner, matched to the aging
Clearing account 190100	zero after the opening entry

Who can do what

30 users in 19 access profiles, with the requester and the approver never being the same person

Segregation of duties

Purchase	Buyer creates the order	Procurement Manager approves above 250,000 EGP
Payment	Treasurer prepares the payment	Finance Manager posts above 500,000 EGP
Journal entry	Accountant prepares the draft	Finance Manager posts and sets the lock date
Stock count	Keeper counts the location	Warehouse Manager applies the adjustment
POS refund	Cashier sells	Showroom Supervisor refunds

Also controlled

- Sales reps see only their own documents
- Chart of accounts, price lists and lock dates limited to named roles
- Chatter records who changed what
- Employee data handled under Law No. 151 of 2020
- Joiner, mover and leaver procedure with quarterly review

Part 05

Testing, training and go-live

Proving the system works, teaching the people, and switching over on the first day of the fiscal year

From UAT to go-live

Two test cycles, ten training sessions and a cutover with a validation pack and a rollback plan

25	70	10	36	14	4
UAT scenarios	requirements covered	training sessions	hours of material	validation checks	weeks hypercare

Cutover

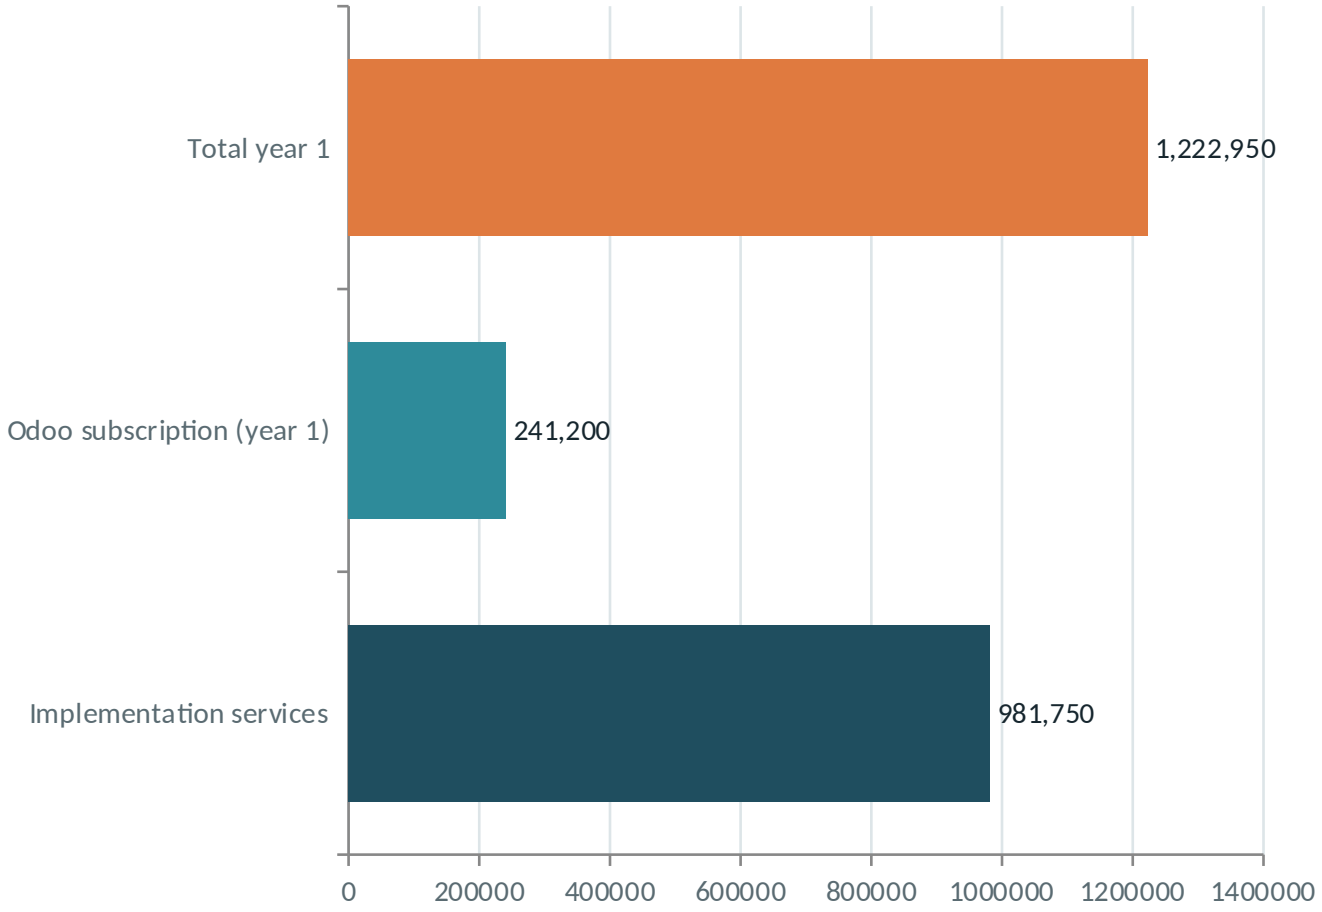

28-29 Dec	Master data frozen and imported into production; every key user verifies their own data
30-31 Dec	Full stock count in all five warehouses and the showroom; legacy system closed for posting
1 Jan	Opening stock and opening entry posted, validation pack run, go / no-go meeting with the sponsor
3 Jan	First working day: first POS session, first delivery and first invoice with a consultant watching

If something goes wrong

- Backup before every import step
- Files re-importable by external ID
- Opening entry can be reset and reposted
- Legacy kept read-only for history

The investment

142 consultant days plus the Odoo subscription — payment released against seven signed milestones

What drives the price

- 142 days across 8 phases, including 15 days of customization
- 30 users on the Odoo Custom plan (Studio is required)
- 10% risk contingency, VAT excluded

Payment milestones

20% kick-off · 15% BRD · 15% design · 20% build · 15% UAT · 10% go-live · 5% hypercare

Figures are project assumptions; the cost model recalculates from the day rate and user count

What we learned

The decisions that made the biggest difference on this project

1 **Data before configuration**

Building the 27 import files first exposed the real problems early: a chart of accounts with 17 duplicates, an inventory balance that did not match the products, and currencies locked on the wrong accounts

2 **Standard first**

Every requirement was tested against standard Odoo before anyone opened Studio, which is why only 16% needed customization

3 **One owner per module**

Each of us owned a module end to end — design, configuration, testing and the user guide — so nothing fell between people

4 **Traceability**

A pain point becomes a requirement, a requirement becomes a design section and a test case; at any moment we can show why a setting exists

Thank you

Live demo: lead → quotation → import with landed costs → fan assembly → showroom sale → financial statements

Repository: 4 folders · 10 project documents · 3 entity-data workbooks · 27 import files

70	89	27	1 Jan 2027
requirements	products	import files	go-live
